## AMENDMENTS TO THE SPECIFICATION

Paragraph [0055], please amend as follows:

preferably derivatives Pegylated erythropoietin contains at least ninety percent mono-PEG conjugates. erythropoietin conjugates of mono-PEG Usually glycoproteins are desirable because they tend to have higher activity than di-PEG conjugates.[[-]] The percentage of mono-PEG conjugates as well as the ratio of mono- and di-PEG species can be controlled by pooling broader fractions around the elution peak to decrease the percentage of mono-PEG or narrower fractions to increase the percentage of mono-PEG in the composition. About ninety percent mono-PEG conjugates is a good balance of yield and activity. Sometimes compositions in which, for example, at least ninety-two percent or at least ninety-six percent of the conjugates are mono-PEG species (n equals 1) may be desired. In an embodiment of this invention the percentage of conjugates where n is 1 is from ninety percent to ninety-six percent..
